

Agricultural

Shipping in containers is an economical and safe way of shipping most types of cargo. But putting cargo into a container also involves a constant risk of moisture damage for almost every kind of cargo on every voyage.

Absortech is a reliable partner with our head office in Sweden and an integrated, global supply chain. We have specialists following the specific needs in a wide range of industries so we can offer you effective moisture protective solutions.

ABSORINSIGHT

Reports state that as much as 50% of the food never reaches the human stomach. Partly because of moisture damages. But moisture damages can be prevented! Absortech offers effective moisture protection for your industry. A small cost that will save money, save the environment and protect your brand.

For many agricultural products, farming, production and container loading takes place in high temperature and high relative humidity climate zones. In addition, the products themselves could have a high degree of moisture. Bringing this type of goods into a container means a high risk for moisture damages. Today, costly reactive actions are made to recondition goods upon arrival.

An easier and much more cost-efficient solution is to use desiccants to absorb the excess moisture during shipment, meaning goods arriving in the same condition as loaded. Desiccants are not designed to dry already wet goods but to reduce and keep the relative humidity in a container on a harmless level by absorbing excess water during shipment.

Typical moisture damages

Mould and mildew

Bad or changed taste

Bugs

Bad or changed smell
